

Smart Door Lock Circuit

Aya Abd AlKarim Yousef

Introduction:

Arduino in Tinkercad circuits, we can build a password-based security system. To allow the user of entering a password, 4×4 keypad module is accompanied with a 16×9 LCD display. Basically, LCD display allows the user of entering a password by the keypad module. The first-time password is “123456”, according to the provided code.

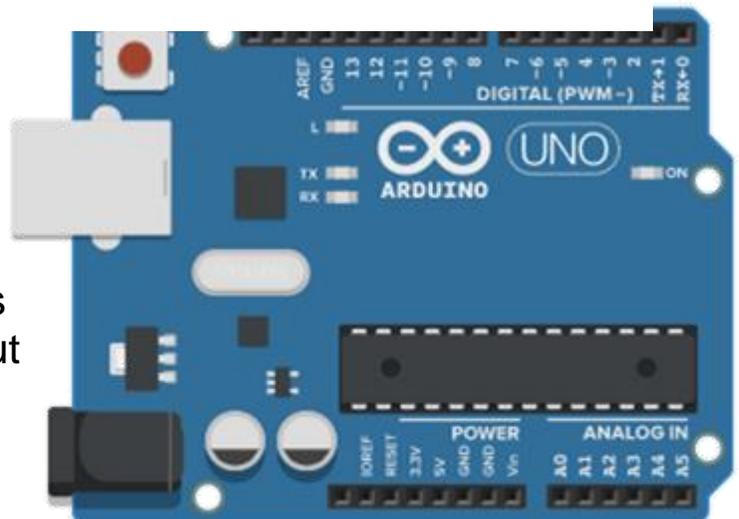

When the system is unlocked, the LCD display shows a message of “Door is Open”. Also, that is controlled and relayed with the Arduino. The data such as the correct passcode, are saved in the Arduino Uno.

Hardware Design:

Components:

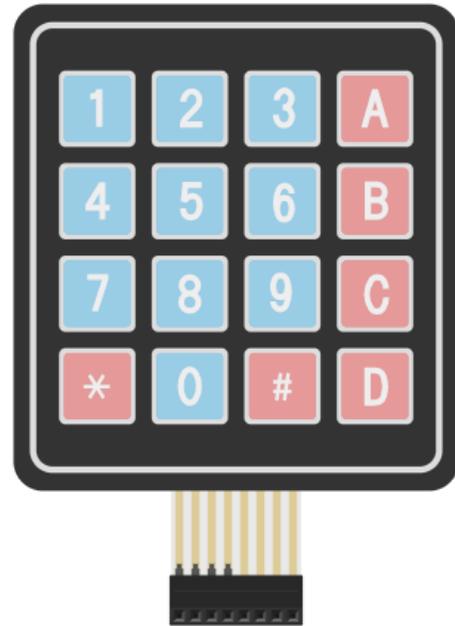

Arduino UNO:

The Arduino Uno is an open-source microcontroller board based on the Microchip ATmega328P microcontroller and developed by Arduino.cc. The board is equipped with sets of digital and analog input/output pins that can be interfaced to various expansion boards and other circuits.

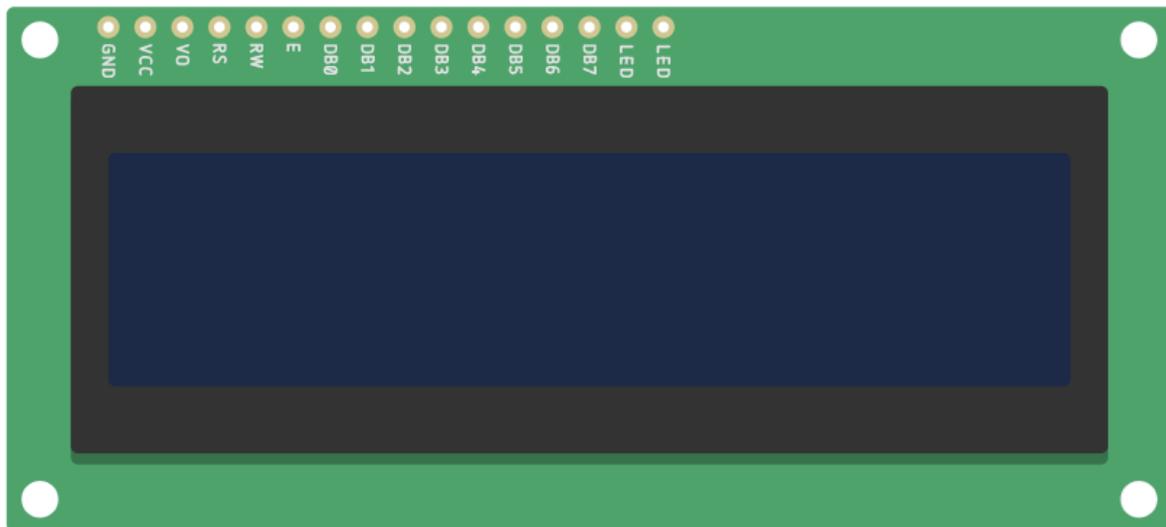

KEYPAD:

A keypad is a block or pad of buttons' set having an arrangement of digits, symbols or alphabetical letters. Pads mostly contain numbers. Numeric keypads are used with computers.

LCD:

A LCD is an electronic display module which uses liquid crystal to produce a visible image. The 16x2 LCD display is a very basic module commonly used in DIYs (Do It Yourself) and circuits. The 16x2 translates a display of 16 characters per line in 2 such lines. In this LCD each character is displayed in a 5x7-pixel matrix.

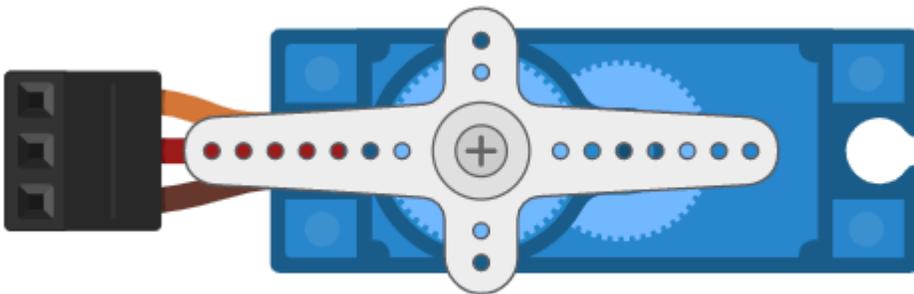

220-ohm Resistor:

A resistor is a passive two-terminal electrical component that implements electrical resistance as a circuit element. In electronic circuits, resistors are used to reduce the current flow, adjust signal levels, divide voltages, bias active elements and terminate the transmission lines.

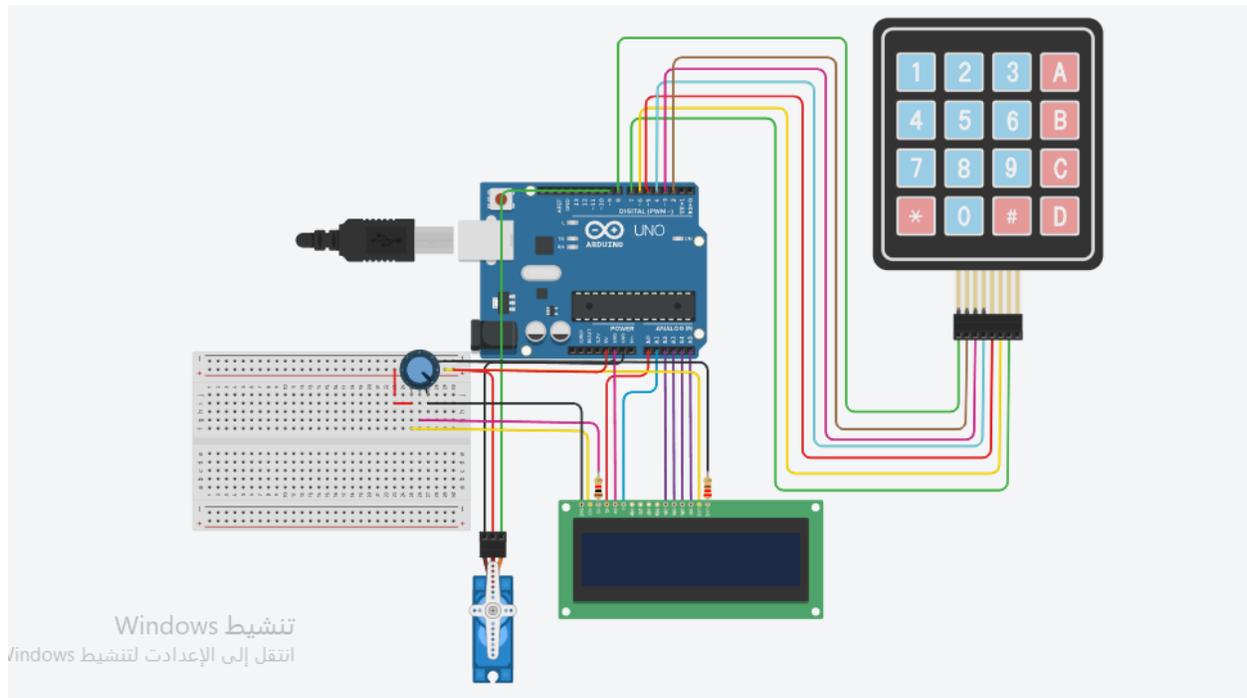

Servo motor:

A servomotor (or servo motor) is a rotary or linear actuator that allows for precise control of angular or linear position and of velocity or acceleration. It consists of a suitable motor coupled to a sensor for position feedback. It also requires a relatively sophisticated controller, usually a dedicated module designed specifically for the use with servomotors.

Hardware Diagram:

Procedure:

At first, we are going to connect the keypad to the Arduino uno. The keypad has 8 pins, 4 of them are for columns and 4 for rows. For the column pins, we are going to connect them with the digital input pins of the Arduino UNO numbers 2 to 4. However, for the row pins we are going to connect them to the digital pins number 5 to 8 of the Arduino UNO.

The code :

```
#include <Keypad.h>

#include <LiquidCrystal.h>

#include <Servo.h>

Servo myservo;

LiquidCrystal lcd(A0, A1, A2, A3, A4, A5);

#define Password_Lenght 7

int pos = 0;

char Data[Password_Lenght];

char Master[Password_Lenght] = "123456";

byte data_count = 0, master_count = 0;

bool Pass_is_good;

char customKey;

const byte ROWS = 4;

const byte COLS = 3;

char keys[ROWS][COLS] = {

    {'1', '2', '3'},

    {'4', '5', '6'},
```

```
    {'7', '8', '9'},  
    {'*', '0', '#'}  
};  
  
bool door = true;  
  
byte rowPins[ROWS] = {8, 2, 3, 4};  
  
byte colPins[COLS] = {5, 6, 7};  
  
Keypad customKeypad( makeKeymap(keys), rowPins,  
colPins, ROWS, COLS); //initialize an instance of class  
NewKeypad  
  
void setup()  
{  
    myservo.attach(9);  
    ServoClose();  
    lcd.begin(16, 2);  
    Serial.begin(9600);  
}  
  
void loop()  
{  
    if (door == 0){
```

```
customKey = customKeypad.getKey();  
if (customKey == '#')  
{  
    lcd.clear();  
    ServoClose();  
    lcd.print(" Door is close");  
    delay(3000);  
    door = 1;  
}  
}  
else Open();  
}  
void clearData()  
{  
    while (data_count != 0)  
    {  
        Data[data_count--] = 0;  
    }  
}
```

```
return;
```

```
}
```

```
void ServoOpen()
```

```
{
```

```
for (pos = 180; pos >= 0; pos -= 5) {
```

```
    // in steps of 1 degree
```

```
    myservo.write(pos);
```

```
    delay(15);
```

```
}
```

```
}
```

```
void ServoClose()
```

```
{
```

```
for (pos = 0; pos <= 180; pos += 5) {
```

```
    myservo.write(pos);
```

```
    delay(15);
```

```
}
```

```
}
```

```
void Open()
```

```
{  
  lcd.setCursor(0, 0);  
  lcd.print(" Enter Password");  
  customKey = customKeypad.getKey();  
  if (customKey)  
  {  
    Data[data_count] = customKey;  
    lcd.setCursor(data_count,1);  
    lcd.print(Data[data_count]);  
    data_count+=1;  
    Serial.println(data_count);  
  }  
  if (data_count == Password_Lenght - 1)  
  {  
    if (!strcmp(Data, Master))  
    {  
      lcd.clear();  
      ServoOpen();  
      lcd.print(" Door is Open");  
    }  
  }  
}
```

```
delay(5000);  
    door = 1;  
}  
else{  
    lcd.clear();  
    lcd.print(" Wrong Password");  
    delay(1000);  
    door = 0;  
}  
clearData();  
}  
}
```
